

TYRE SAFETY TIPS

HOW MUCH AIR PRESSURE SHOULD I PUT INTO MY TYRES?

The amount of pressure a tyre requires depends on its type and the vehicle. You can find out the optimum air pressure either printed on the side of the door, the side-wall of the tyres, or in your owner's manual. Remember that for desert drives you need to deflate your tyres to 15 Psi, but ensure to inflate them straight after your drive, not to damage the tyres.

NITROGEN OVER REGULAR AIR

We always recommend inflating your tyres with Nitrogen, especially in this region. Nitrogen doesn't evaporate like regular air in the heat, ensuring increased fuel economy, longer tyre life, and improved handling.

TYRE WEAR

For your vehicle to steer, brake and stay on the road safely it is vital your tyres are kept in good condition and checked regularly.

The new tyre tread depth is 8-6mm and can go down to 3mm. Legally you are allowed to go to 1.6mm, but this does greatly affect your stopping distance.

HERE ARE THE 5 WAYS YOU CAN AVOID FAST TYRE WEAR:

- Maintain correct tyre pressures
- Avoid harsh braking
- Avoid hard cornering
- Avoid aggressive acceleration
- Do not overspeed

We recommend you visit one of our locations, so a trained professional can assess your tyres for free.

WHAT SIZE IS MY TYRE?
